A letter about the functionality and use of the Carcam-SD

Dear SecurityMan,

I just purchased my Carcam-SD from Fry's Electronics. As soon as I step out of the store opened the packaged and install it to my windshield and started immediately driving without setting anything with Micro SD Card (sold separately) 32 GB Class 10. Opening the package takes more time than installing and making it work. When I get home, I pull the SD Card and plug it on my computer card reader and I was amazed by the picture and sound it captured with its factory setting. The picture is clear (1080 FHD) and the sound is audible, you can listen and understand the music that is playing on the radio.

If you are getting a fuzzy picture or the picture is not very clear...I would suggest and highly recommend to clean your windshield very well Inside and outside...no STREAK, where you attach your Carcam-SD. Then you can play with the setting in your Carcam-SD. There are 4 settings for video ...480...720....1080...1080FHD....see what is best for your eyes....you are the one who is going to watch it....Aside from being used in case of an accident...it is also good for road trips....instead of someone video taping it for you....and you can narrate your location while driving hands free...with smooth and steady shot.....what else can you ask for....

Calling SecurityMan support they were very helpful in answering my question from the operator to the person who is going to help you...Thank you and more power...
